

Radio button

Radio buttons allow the user to select one option from a set. Use radio buttons when the user needs to see all available options. If available options can be collapsed, consider using a dropdown menu because it uses less space.

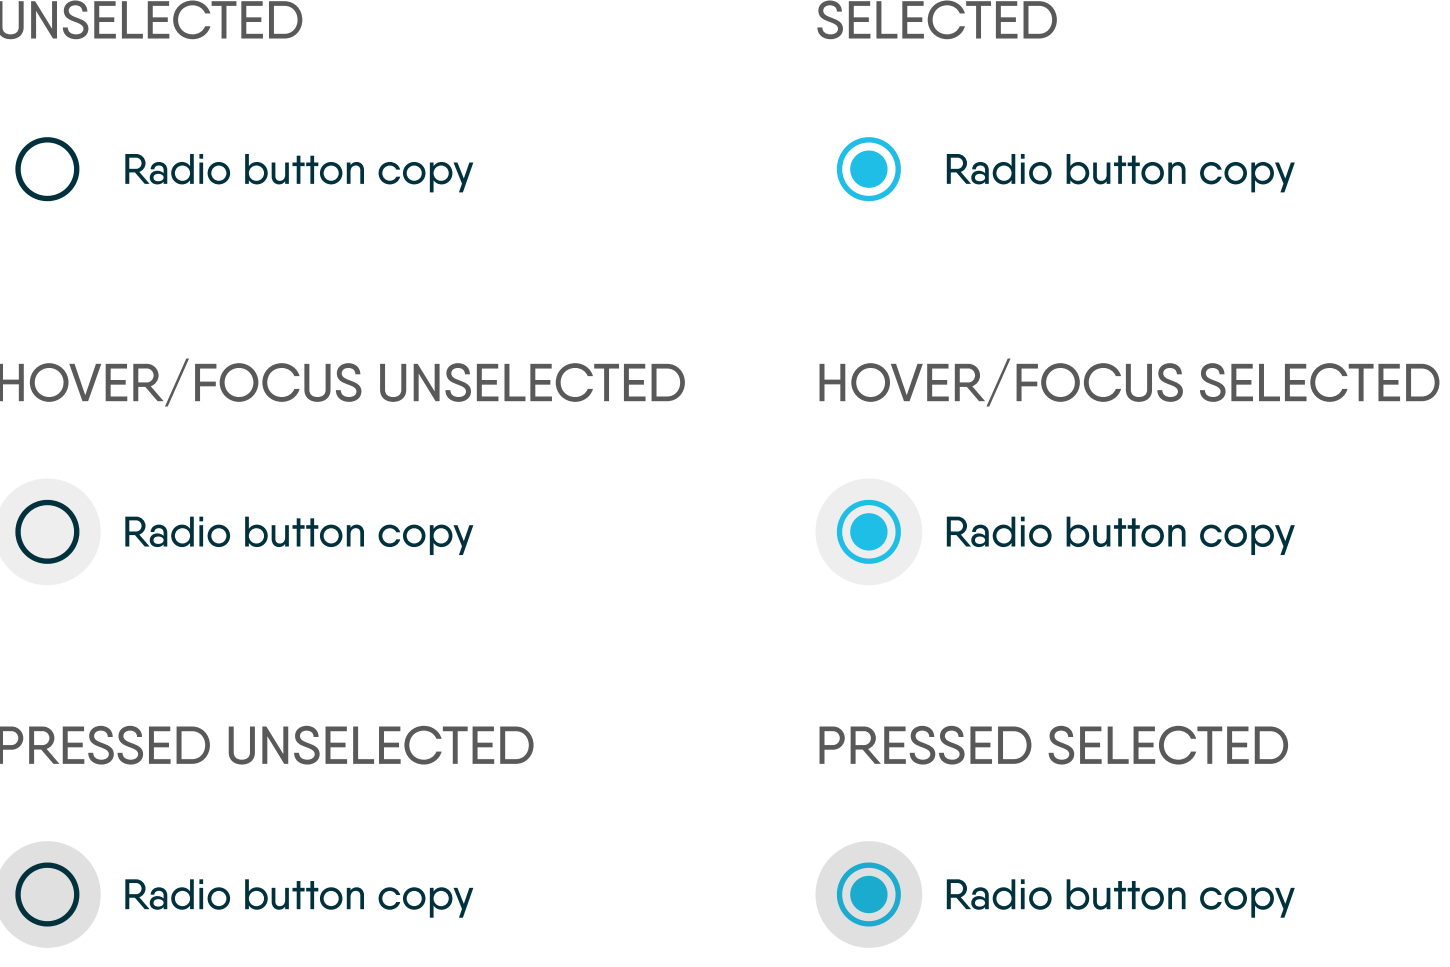

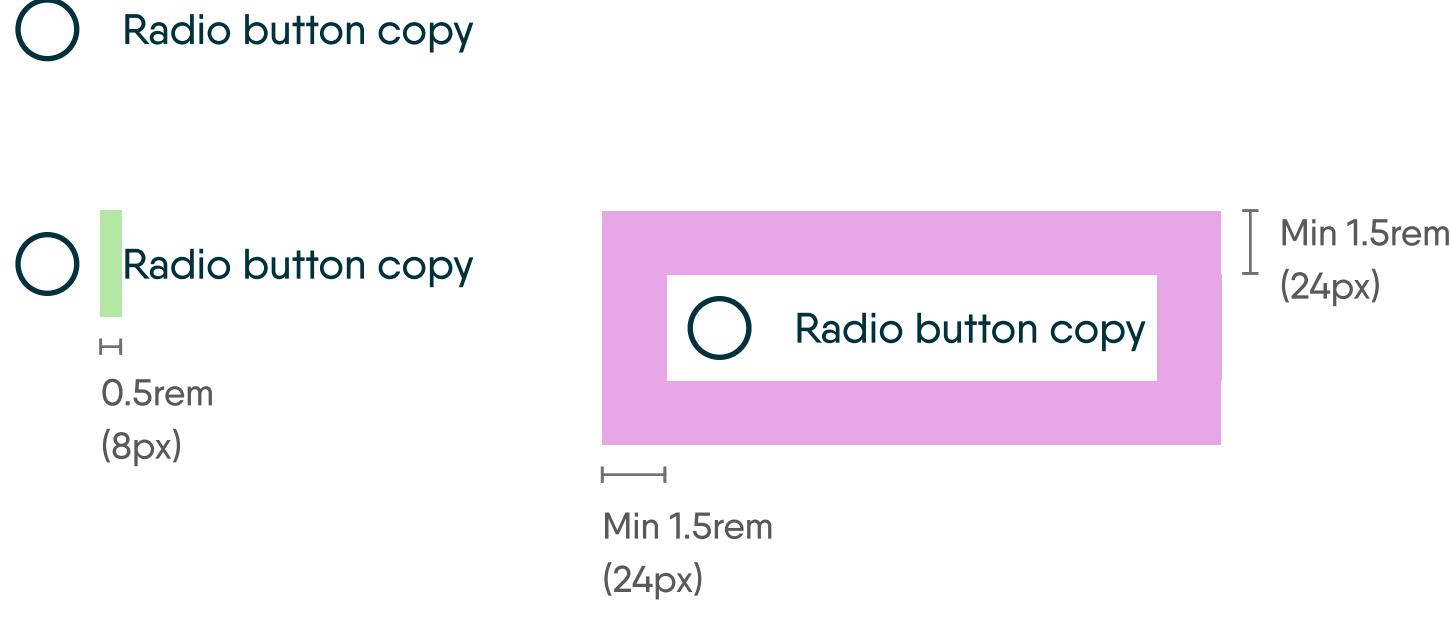

Other selection controls

Selection controls allow users to complete tasks which involve making choices such as selecting options, switching settings on or off, or adding or removing items.

Component	Use case
Radio buttons	<ul style="list-style-type: none">- Select a single option from a list- When the user needs to see all available options in a list
Checkboxes	<ul style="list-style-type: none">- Select one or more options from a list- When the the user can see a selection of options but choose to see all
Switches	<ul style="list-style-type: none">- Toggle a single item on or off- Immediately activate or deactivate something

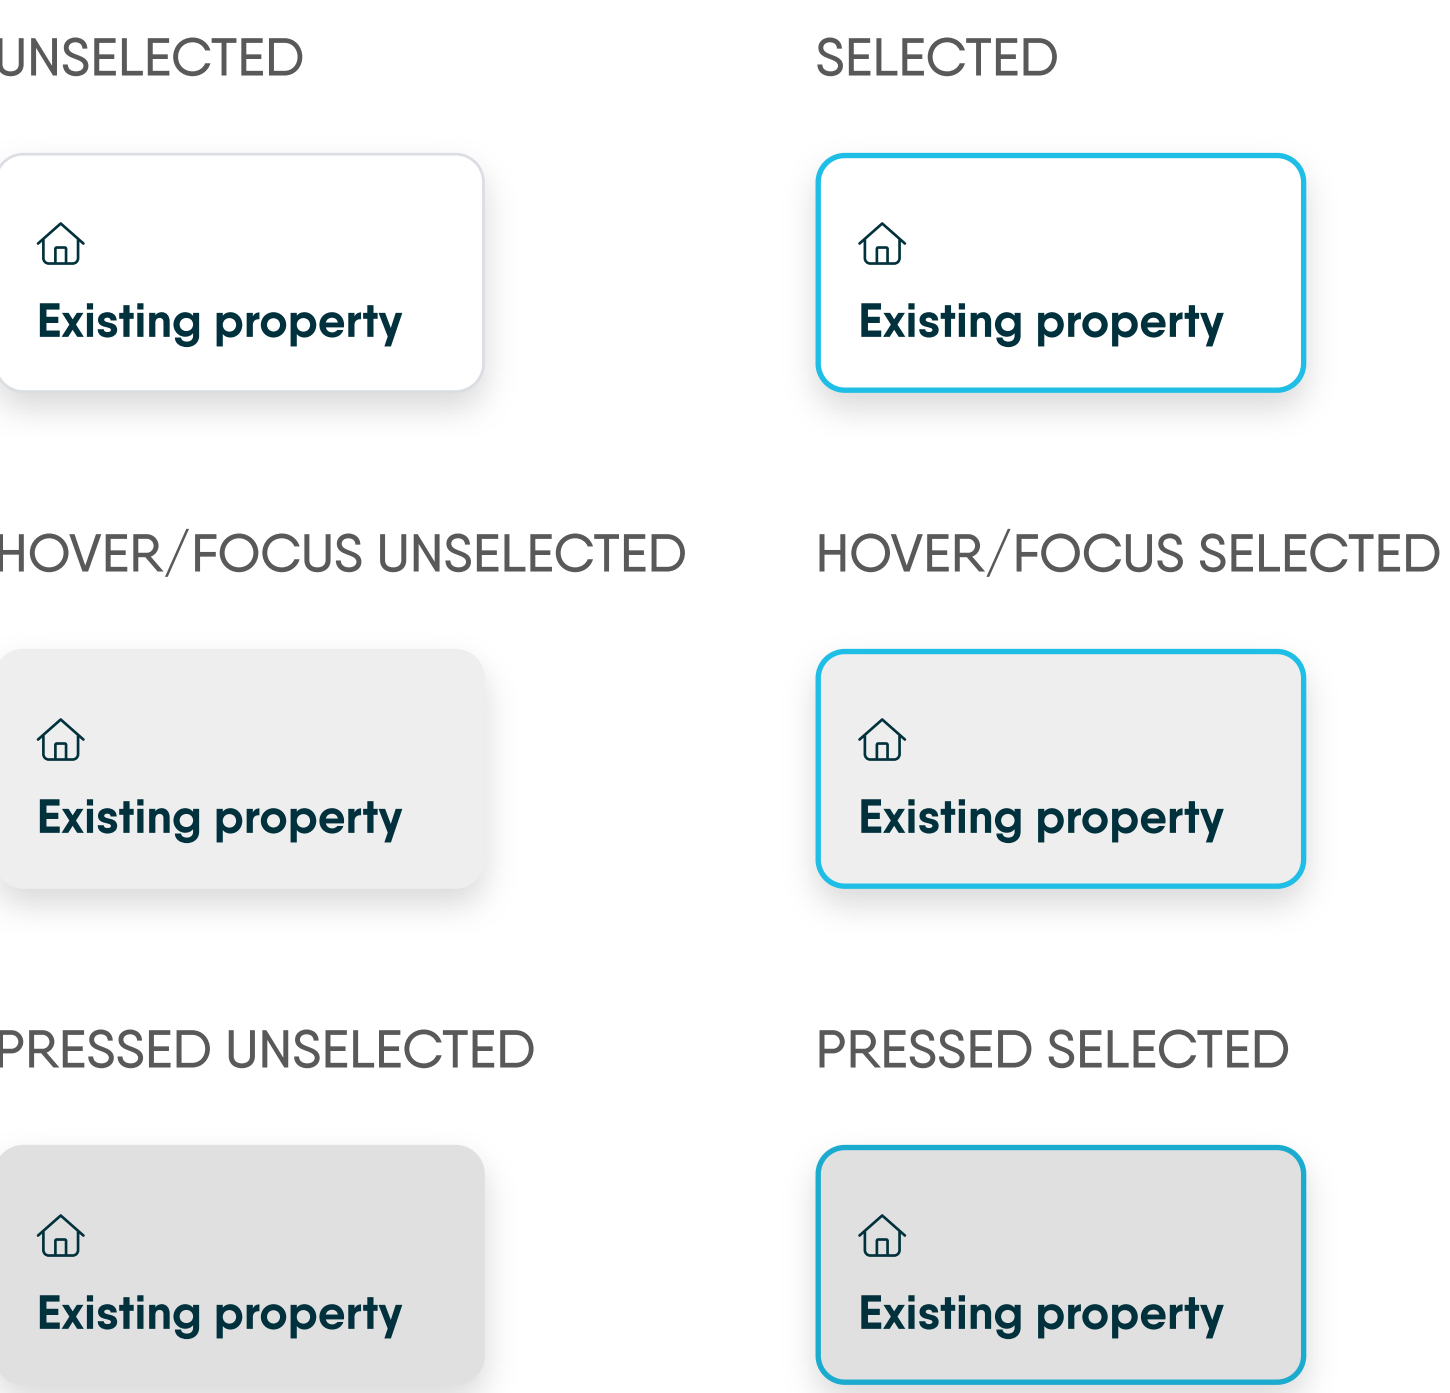

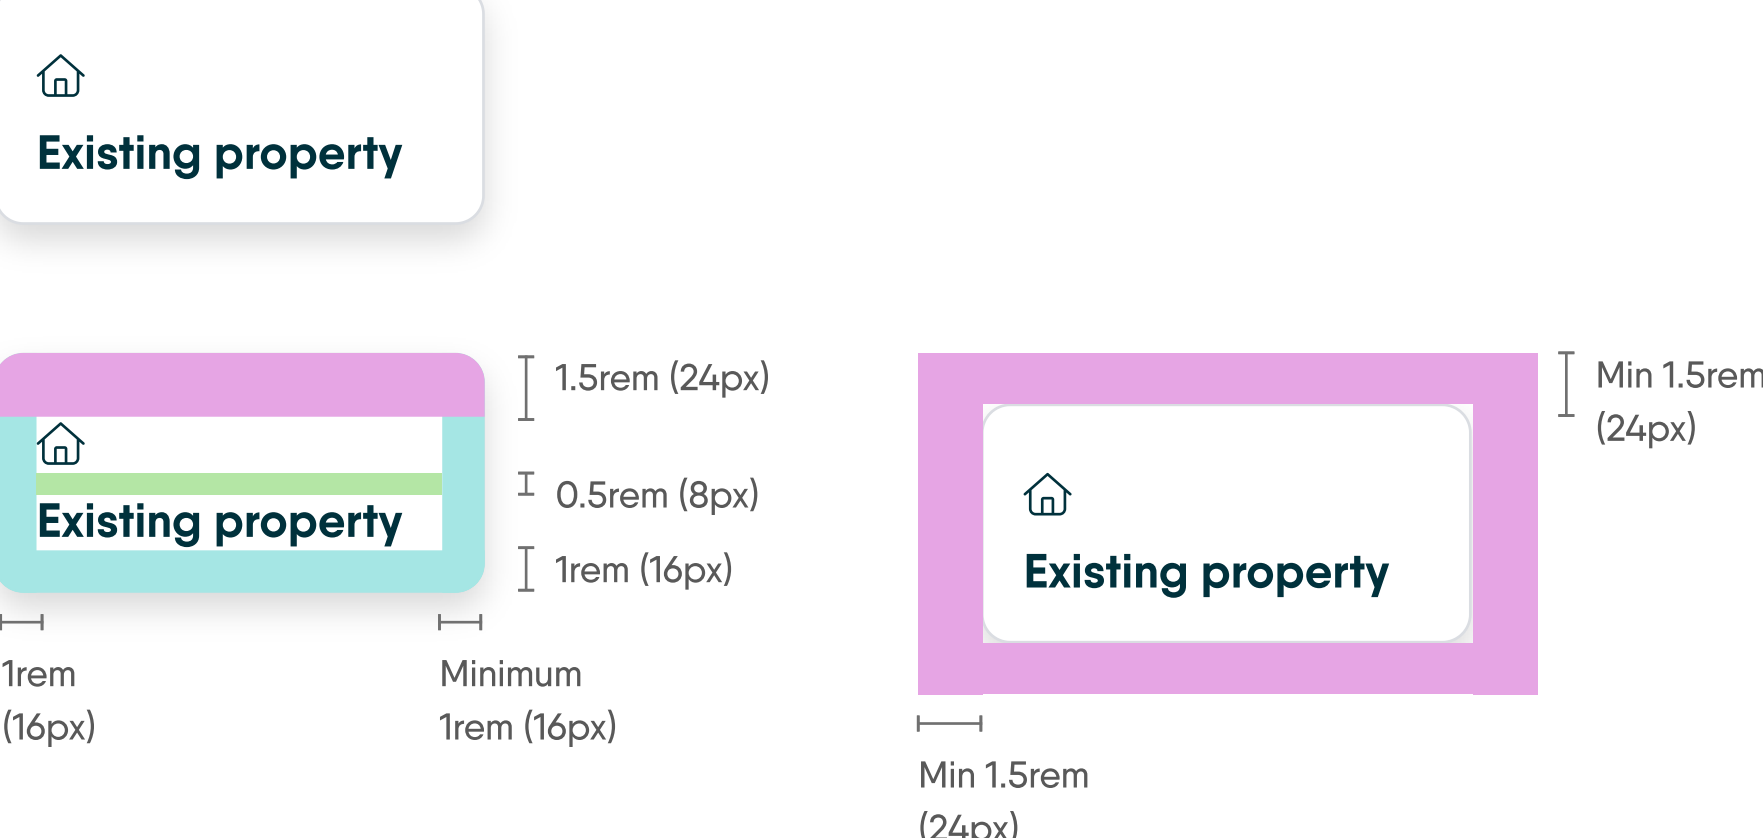

Standard radio button

Standard radio buttons feature a button alongside a label. The label should clearly explain the option that can be selected. The button should sit in a container of 2.5rem (40px) with 0.5rem (8px) of padding between the button and the label.

Card radio button

Card radio buttons feature similar styling to the 'text and icon filter card' on the [cards](#) style guide. The radio button provides user with an optional visual aid (icon) as well as a text label to ensure the user gains a quicker understanding of the radio button selection. This radio button can also apply a drop shadow with a default colour of HEX #000000, 6px Y-axis and 12px blur with an opacity of 15%.

Reveal of content radio button

These are best used at the beginning of a section of the form to determine which type of fields are presented to the user.

For example, we might use this type of radio button for the options 'Existing Property' and 'New Property' then show the relevant fields below once the option has been selected.

Both card and standard radio buttons can be used to reveal content.
